NAVY GRADUATE COMPTROLLERSHIP PROGRAM

ACCOUNTING COMMUNICATION WITH MANAGEMENT

by

Charles H. Walker
Captain, U. S. Marine Corps

for

Dr. A. Rex Johnson

January, 1956

PREFACE

During the conferences and speaker's sessions held at the George Washington University for the 1955-56 Navy Graduate Comptrollership Program, the writer has become acutely aware that there are many misunderstandings that exist between management and the accounting departments of most industrial corporations. It is this writer's contention that a primary cause of these misunderstandings should be attributed to a lack of adequate communication.

The object of this paper is to define accounting and portray major aspects of its current role and its potentiality in any business organization.

It is hoped that the review will be adequate to help communicate a better understanding to the layman, accountant, and operating people in general of Accounting's responsibilities and uses and that it will suggest areas of communication which possibly should receive greater consideration by accountants in order to improve relationships.

The writer is indebted to Mr. John F. Soltis for his valuable ideas, contributions and suggestions in the preparation of this paper, and to Miss Braun for the typing of the final draft.

CHAPTER I

INTRODUCTION

"Accountants, generally speaking, have not been too successful in giving management the kind of informational service it needs and wants."¹
David R. Anderson¹

It is significant that a lack of harmony and understanding exists between line management and accountants in most organizations. Few accountants and operating people would hesitate to differ with this supposition. It would be most gratifying if accountants did enjoy the complete confidence of operators, but it is obvious that this is too optimistic a view.

Unfortunately, some misunderstanding does persist despite the fact that accounting, as a profession and as a business aid, has made tremendous strides in a relatively short time. Whereas initially and for many years accounting, or "bookkeeping" as it is now differentiated, merely recorded facts it now can portray the pulse of a living enterprise. It provides material by which a business's economic health at any given time can be judged with reasonable accuracy, and from which educated guesses concerning the future can be made. Accounting can and does make a material contribution to operating efficiency.

This glowing picture of the importance of accounting is supported by an impressive list of literature, much of it emanating from accountants themselves. But plaudits for accounting frequently come from outside the profession. In this respect, Mr. Joseph A. Sherman, Vice-President of a mining corporation, made the following statement, "the financial executive and his organization are

INTRODUCTION

"Accountants, generally speaking, have not been too successful in management the kind of informational service it needs and wants." David R. Anderson

It is significant that a lack of harmony and understanding exists between the management and accountants in most organizations. The accountants and operating people would hesitate to differ with this supposition. It would be most gratifying if accountants did enjoy the complete confidence of operating people, but it is obvious that this is too optimistic a view.

Unfortunately, some misunderstanding does persist despite the fact that accounting, as a profession and as a business aid, has made tremendous strides in a relatively short time. Whereas initially and for many years accounting or "bookkeeping" as it is now differentiated, merely recorded facts it now portrays the pulse of a living enterprise. It provides material by which business's economic health at any given time can be judged with reasonable accuracy, and from which educated guesses concerning the future can be made. Accounting can and does make a material contribution to operating efficiency. This glowing picture of the importance of accounting is supported by impressive list of literature, much of it emanating from accountants themselves. But pleading for accounting frequently comes from within the profession. In this respect, Mr. Joseph A. Sherman, Vice-President of a mining corporation made the following statement, "The financial executive and his organization

best equipped, because of their responsibilities and opportunities in relation to all parts of the business, to aid top management in coordinating and controlling plans for the harnessing of the special interests which in the aggregate comprise any business."¹

Another plaudit for accounting was expressed by Mr. Chester F. Lay who wrote, "at the very least operating management is heavily dependent on accountancy--more so than it is generally aware of--for operating facts and a steadying hand."²

Of course, accountants are encouraged by such statements and possibly derive considerable satisfaction from them. It can be concluded that they have carved out a well-recognized niche in business. However, it is possible that the very words and phrases often used to describe accounting's place in business may tend to create misunderstanding. This writer has been impressed with the fact that many of the guest speakers before the Navy Graduate Comptrollership Program students have presented and discussed accounting as a vital tool for establishing, coordinating, and controlling operating programs and plans. Without proper explanation as to the extent to which accounting functions in these respects, it is not surprising that these references could incite resentment on the part of operators.

¹Statement by Joseph A. Sherman, personal interview

²Chester F. Lay, "The Functional Cycles of Accounting and Management," National Association Cost Accountants Bulletin, (June 15, 1949), p. 1176.

best equipped, because of their responsibility and opportunities in relation to all parts of the business, to aid top management in coordinating and controlling plans for the harnessing of the special interests which in the end will comprise any business."¹

Another credit for accounting was expressed by Mr. Chester F. Lay who wrote, "at the very least operating management is heavily dependent on accountancy--more so than it is generally aware of--for operating facts are steadily hand."²

Of course, accountants are encouraged by such statements and possibly derive considerable satisfaction from them. It can be concluded that they have carved out a well-recognized niche in business. However, it is possible that the very words and phrases often used to describe accountancy's place in business may tend to create misunderstanding. This writer has been impressed with the fact that many of the guest speakers before the City Graduate Committee in the Program students have presented and discussed accounting as a tool for establishing, coordinating, and controlling operating programs and plans. Without proper explanation as to the extent to which accounting functions in these respects, it is not surprising that these references may incite resentment on the part of operators.

CHAPTER II

A CRITICAL VIEW OF ACCOUNTING

From this writer's limited experience, it is known that accountants on many occasions have encountered those who interpreted their objectives or uses of accounting to mean that the accountant's sole purpose is to confuse issues, tell them what they cannot do and carry on an espionage service. Perhaps the most severe critic of accounting was the late General George S. Patton, U. S. Army, who said "all goddam auditors should be in the bottom of hell!"¹

The late Carl F. Braun was another who severely criticized industrial accounts and accounting. He stated in his booklet "Objective Accounting":

"The people who run an industrial enterprise are enormously dependent for good operation on the guides and checks that only a truly objective accounting department can provide. Yet these people are not getting what they need. A great gulf exists between the accountants and the rest of the organization."²

Mr. Braun discussed a number of specific areas in which he felt accountants were deficient but this writer believes that taken all together, these deficiencies or the "gulf" which exists, can be summed up as resulting from a lack of communication, a lack of communication between operating management and accountants in both directions and a failure on behalf of both to encourage communication.

¹George S. Patton, cited by E. C. Mosher, in Program Budgeting: Theory and Practice, (New York: Stratford Press, Inc., 1954), p. 98.

²Carl F. Braun, Objective Accounting, Alhambra, Calif., C. F. Braun & Co., 1933, p. iv.

Most accountants have undoubtedly striven to become acquainted with operators and to furnish operating management with helpful information. But the accountants may have furnished information as they have interpreted operating needs and may have failed to develop what operators' needs are as they see them. In all probability, the presumed differences have been further magnified by a need for more clarity of expression and by unnecessary emphasis in many cases, by accountants, on accuracy from an absolute standpoint. Balancing and distributing dollars and pennies has been clothed with an importance unrelated to the actual values or operations concerned. In their preoccupation with the task of keeping abreast with the needs of the times, resulting from increased industrialization and competition, accountants may have failed to convey to all of operating management a reasonable understanding of their administrative responsibilities and of the services they can render.

Accountants are frequently criticized for their failure to provide management with more lucid reports. It is a common failing in many reports that they are too detailed, consequently management takes the accountant to task for obscuring pertinent facts. This condition results from the instinctive nature of the average accountant to put too much emphasis on the details in report writing and possibly from the fact that it is usually considered better to be criticized for too much detail than for a glaring omission. It is claimed by many business leaders that too many of the accountants reports are designed for the use of other accountants, rather than for operating management. Business leaders complain that accountant's reports are not timely enough and that they do not adequately present a clear enough picture of operations on which management can make proper decisions. In an article for

Most accountants have undoubtedly striven to become acquainted with operators and to furnish operating management with helpful information. The accountants may have furnished information as they have interpreted it. They may have failed to develop what operators' needs are as to see them. In all probability, the pronounced differences have been further magnified by a need for more clarity of expression and by unnecessary emphasis on error, by accountants, as economy from an objective standpoint. In making and distributing dollars and pounds has been clothed with an importance unrelated to the actual values or operations concerned. In their procedure with the task of keeping abreast with the needs of the time, resulting in increased information and competition, accountants may have failed to convey to all of operating management a reasonably understanding of their administrative responsibilities and of the services they can render.

Accountants are frequently criticized for their failure to provide management with more useful reports. It is a common failing in many reports that they are too detailed, unnecessarily cumbersome, and the accountant's task for obtaining business facts. This condition results from the fact that the nature of the average accountant to put too much emphasis on the detail in report writing and possibly from the fact that it is usually considered better to be criticized for too much detail than for a glaring omission.

It is claimed by many business leaders that too many of the accountants' reports are designed for the use of other accountants, rather than the operating management. Business leaders complain that accountants' reports are not as good, and that they do not adequately present a clear enough picture of operations on which management can make proper decisions. In an article

the Controller magazine by Mr. Elmer L. Lindseth, he summed up management's dissatisfaction with accounting reports by stating:

"Accounting will have its fullest value in those companies whose accounting executives--in fact, whose full accounting organization, realize and practice the principle of 'account for operators' instead of 'account for accountants'."¹

¹Elmer Lincoln Lindseth, "Getting Accounting Out of Its Strait-Jacket", The Controller, (New York; September 1951), p. 405.

The Controller suggests by Mr. Elmer L. Lindseth, he summed up management's

dissatisfaction with accounting reports by stating:

"Accounting will have its fullest value in those companies whose accounting executives--in fact, whose full accounting organization, realize and practice the principle of 'account for operators' instead of 'account for accountants'."

CHAPTER III

ACCOUNTING DEFINED

Because there is much adverse criticism of accountants and accounting in general, it is believed that accountants should avail themselves of every opportunity to shed light on their specialty and its potential, without prejudice, and to seek light on their deficiencies.

The author proposes to attempt to do this by answering and elaborating briefly on the question: "What is Accounting?"

A great deal of thought has been given this question and it is realized that accounting has been defined on numerous occasions by many persons, groups and institutions. Out of the many definitions, the author prefers the one from a booklet entitled "Dealing in Dollars", which was published by the Humble Oil and Refining Company for the information of its employees:

"Accounting is one of the services that business management uses to appraise the effectiveness of its policies, to analyze its major financial problems, to fix responsibility for performance, to control operating results, and to protect the properties of the business."¹

This definition is a particularly good one for several reasons. First, although tersely phrased, it imparts an immediate picture of the responsibilities and objectives of accounting, and indicates that they are constructive in nature. Second, the reference to business management is all-inclusive and covers all levels of management from foreman to top management. Third, and most important in this author's opinion, it states at the outset that account-

ACCOUNTING DEFINED

Because there is much adverse criticism of accountants and accounting in general, it is believed that accountants should avail themselves of every opportunity to shed light on their specialty and its potential, without prejudice, and to seek light on their deficiencies.

The author proposes to attempt to do this by answering and elaborating briefly on the question: "What is Accounting?"

A great deal of thought has been given this question and it is felt that accounting has been defined on numerous occasions by many persons, groups and institutions. Out of the many definitions, the author prefers the one a booklet entitled "Dealing in Dollars", which was published by the Shell and Refining Company for the information of its employees:

"Accounting is one of the services that business management uses to appraise the effectiveness of its policies, to analyze its major financial problems, to fix responsibility for performance, to control operating results, and to protect the properties of the business."¹

This definition is a particularly good one for several reasons. First, although tersely phrased, it imports an immediate picture of the responsibilities and objectives of accounting, and indicates that they are constructive. Second, the reference to business management is all-inclusive and covers all levels of management from foreman to top management. Third, and most important in this author's opinion, it states of the nature that accounting

¹"Dealing in Dollars", (Shell Oil and Refining Company, Houston, Texas, 1940), p. 1.

ing is a "service function", and is only one of the services used.

This last point cannot be overemphasized. It is the key to a real understanding of accounting. Accounting has absolutely no value other than the extent to which its products "serve" some individual or group in one form or another. Sincere accounting practitioners have only one objective in mind, and that is to devise procedures and gather information which serve a useful purpose, and to do this as economically, simply and promptly as possible.

To present a comprehensive view of how the accounting department serves the company, a typical organization of the accounting departments is shown in Figure 1, page 8. This organization structure is not to be considered to be that of any particular company, but should be viewed as this writer's concept of an average or composite structure of the functional organization required by the chief financial executive.

On page 9, the description of functions is shown. From the foregoing it can be seen that accounting is a major division of organization. Accounting is found and felt at all levels of management. This authority, influence, and capacity of the accounting division to serve management from top to bottom is very evident.

is a "service function", and is only one of the services used.

This last point cannot be overemphasized. It is the key to a real understanding of accounting. Accounting has absolutely no value other than the extent to which its products "serve" some individual or group in one way or another. Where accounting procedures have only one objective in mind and that is to devise procedures and gather information which serve a user purpose, and to do this as economically, simply and promptly as possible.

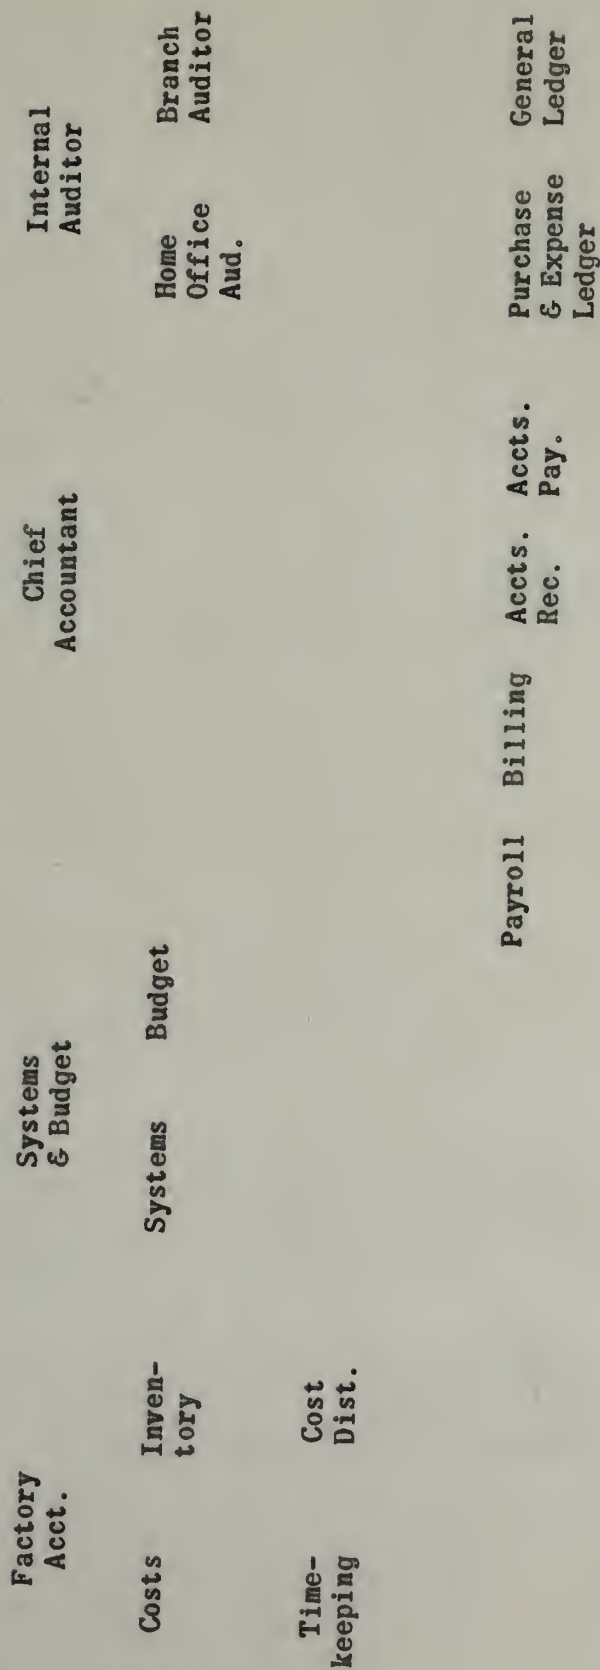

In present a comprehensive view of how the accounting department of the company, a typical organization of the accounting department is shown in Figure 1, page 8. This organization structure is not to be confused with that of any particular company, but should be viewed as this organization's copy of an average or composite structure of the functional organization devised by the chief financial executive.

On page 9, the description of functions is given. From the foregoing it can be seen that accounting is a major division of organization. Accounting is found and felt at all levels of management. This authority, influence, and capacity of the accounting division to serve management from top to bottom is very evident.

DESCRIPTION OF FUNCTIONS IN THE ACCOUNTING DEPARTMENT

COSTS:	Control by relating all costs to production and measuring results.
INVENTORIES:	Maintenance of perpetual inventory records to hold inventory custodians accountable.
SYSTEMS:	Designs, methods and procedures to provide maximum efficiency and effective internal control.
BUDGET:	Control by comparison of operating results with predetermined budget estimates.
HOME OFFICE AUDITORS:	Audit of those phases of the business not susceptible to automatic internal control or where such control would be too costly.
TIMEKEEPING:	Control over payroll liability by verification of time and earnings.
COST DISTRIBUTION:	Determines or approves accounting disposition of all material, labor and expense charges.
PAYROLL:	Establishes payroll liability on basis of time reports and authorized rates.
BILLING:	Determines billing value of shipments and establishes control over sales.
ACCOUNTS PAYABLE:	Verifies the documents supporting the disbursement voucher and the accounting disposition.
ACCOUNTS RECEIVABLE:	Responsible for keeping individual accounts.
PURCHASE AND EXPENSE LEDGER:	Records and summarizes purchases and expenses for control through reports.
GENERAL LEDGER:	Controls all subsidiary ledger accounts by accumulating totals from independent sources.

Figure 2

DESCRIPTION OF FUNCTIONS IN THE ACCOUNTING DEPARTMENT

COSTS:	Control of relating all costs to production and marketing results.
INVENTORIES:	Maintenance of perpetual inventory records to hold inventory constant throughout.
SYSTEMS:	Design, methods and procedures to provide maximum efficiency and effective internal control.
BUDGET:	Control by comparison of operating results with predetermined budget estimates.
WORK OFFICE AUDITORS:	Audit of those phases of the business not susceptible to automatic internal control or where such control would be too costly.
TIMEKEEPING:	Control over payroll liability by verification of time and earnings.
COST DISTRIBUTION:	Determination or approval accounting disposition of all material labor and expense charges.
PAYROLL:	Establishes payroll liability on basis of time reports and authorized rates.
BILLING:	Determines billing value of shipments and establishes credits over sales.
ACCOUNTS PAYABLE:	Verifies the documents supporting the disbursement voucher and the accounting disposition.
ACCOUNTS RECEIVABLE:	Responsible for keeping individual accounts.
PURCHASE AND EXPENSE LEDGERS:	Records and summarizes purchases and expenses for control through reports.
GENERAL LEDGER:	Controls all subsidiary ledger accounts by accumulated totals from independent sources.

CHAPTER IV

POLICIES APPRAISED AND PROBLEMS ANALYZED

Whereas the main purpose of this paper is to explore and discuss accounting in relation to operating management, this writer believes that the first two areas of accounting responsibility mentioned in the definition quoted should be covered rather briefly. These accounting services relate primarily, if not solely, to the overall position and results of the business, and accordingly are the concern of top management. Although such influence as accounting may have on policy and finance decisions will ultimately affect operating management, they reflect conditions beyond the specific scope of operating responsibility. Even the accumulation or analysis of accounting records and detail to support these considerations does not place any extra burden on operating personnel. In the main, the information can be considered the end product, or by-product of accounting detail required or gathered for other purposes. Using accounting in connection with overall policy and financial matters is more properly within the controllership function, rather than the industrial accounting function.

Accounting is subservient to the controllership function. This fact is pointedly brought out by Mr. Darrell H. Voorhies in an article for the Corporate Treasurer's and Controller's Handbook, who wrote:

"As an officer of the company and a staff member of management, the controller is charged with advising the president and conducting and furnishing functional guidance to the management and departments on accounting, auditing, income and excise tax matters, forecasting and economic matters, budgets, the preparation and payments of payrolls, the compilation of statistics, and office methods, systems and pro-

CHAPTER IV

POLICIES APPLIED AND PROBLEMS ANALYZED

Whereas the main purpose of this paper is to explore and discuss accounting in relation to operating management, this writer believes that the first two areas of accounting responsibility mentioned in the definition should be covered rather briefly. These accounting services relate primarily and chiefly to the overall position and results of the business, and indirectly are the concern of top management. Although such influence as accountants may have on policy and finance decisions will ultimately affect operating management, they reflect conditions beyond the specific scope of operating responsibility. Even the accumulation or analysis of accounting records is detail to support these considerations does not place any extra burden on operating personnel. In the main, the information can be considered the way it is or by-product of accounting detail required or gathered for other purposes. Using accounting in connection with overall policy and financial matters is more properly within the controller's function, rather than the industrial accounting function.

Accounting is subservient to the controller's function. This fact is pointedly brought out by Mr. Gattell N. Voorhies in an article for the Controller's and Controller's Handbook, who writes:

"As an officer of the company and a staff member of management, the controller is charged with advising the president and assisting in furnishing functional guidance to the management and departments on accounting, auditing, income and estate tax matters, investing and economic matters, budgets, the preparation and payments of payrolls, the compilation of statistics, and office methods, systems and pro-

cedures."¹

From the foregoing it is obvious that accounting is just one of the tools used by the controller which makes it possible for him, working with and as a part of top management to help formulate overall policy and objectives.

The essence of a financial policy was highlighted by David R. Anderson in his book, Practical Controllershship, who wrote:

"A financial policy for any given business is simply a policy or plan for (1) procuring the necessary funds to operate the business and (2) determining how those funds shall be used; it is a plan to answer the two important questions; 'Where is the money coming from?' and 'What is the available money to be used for?'"²

In this connection it is necessary to briefly illustrate the objectives of a financial policy. Mr. Anderson states that the objectives of a dynamic financial policy are;

"1. The procurement of the capital required for the operations of the business at a minimum cost consistent with the maintenance of a sound financial structure.

2. The investment of such capital to the best advantage of the business."³

The determination or establishing of any objective or policy which clearly implies continuing or longer-term considerations can involve a great variety of conditions and results, dependent upon and affecting sales and production volumes, prices, taxes, inventories, credit, cash availability, and so forth. These conditions must be appraised in order that the policy or

¹Darrell H. Voorhies, "The Treasurer and The Controller", Corporate Treasurer's and Controller's Handbook, (New York: Prentice-Hall Inc.) p. 41.

²David R. Anderson, Practical Controllershship, (Chicago: Richard D. Irwin, Inc., 1949), p. 445.

³Ibid., p. 445.

understand."

From the foregoing it is obvious that accounting is just one of the tools used by the controller which makes it possible for him, working with and as a part of top management to help formulate overall policy and objectives.

The passage of a financial policy was highlighted by David R. Anderson in his book, Practical Financial Control, who wrote:

"A financial policy for any given business is simply a policy or plan for (1) providing the necessary funds to operate the business and (2) determining how those funds shall be used; it is a plan to answer the two important questions: 'Where is the money coming from?' and 'What is the available money to be used for?'"

In this connection it is necessary to briefly illustrate the object of a financial policy. Mr. Anderson states that the objectives of a financial policy are:

1. The procurement of the capital required for the operations of the business at a minimum cost consistent with the maintenance of a sound financial system.
2. The investment of such capital in the best advantage of the business.

The determination or establishing of any objective or policy which clearly implies controlling or longer-term consideration can involve a variety of conditions and results, dependent upon how affecting sales and production volumes, prices, rates, expenses, assets, cash availability, etc. These conditions will be specified in order that the policy or

David R. Anderson, Practical Financial Control, (Chicago: Richard D. Irwin, Inc., 1949), p. 145.

objective established will provide the most effective results. Such an appraisal is usually within the controllership function in the organization. It is within the realm of controllership to answer management's question, 'Where are we going?'. T. F. Bradshaw in his book, Developing Men For Controllership, points out that the controller within the organization is qualified to answer questions which require

"(a) an appraisal of the future, (b) a knowledge of the past, (c) access to figures throughout the organization, (d) an ability to fit the pieces together in terms of the objectives of the whole community."¹

Accounting detail provides the means of evaluating known conditions and the stepping stones for estimating alternate or future conditions. Accounting also reflects the results of policies and objectives, and points up possible financial problems.

These are top-level problems and the controller plays an important part in their consideration and solution. But it is not intended to over-emphasize the controllership function. Obviously, the variety of conditions and problems suggested are operating in nature and accordingly accounting information can only be used to evaluate them. It is pertinent to note at this point that "the controller does not control, he simply provides extremely valuable control mechanisms--control itself being a line responsibility."²

¹T. F. Bradshaw, Developing Men For Controllership (Boston: Harvard Univ., 1950), p. 9.

²Glenn A. Welsh, "The Controllers Function in Top-Level Management", The Journal of Accountancy, Vol. II-c, July, 1954, p. 69.

objective established will provide the most effective results. Such an appraisal is usually within the controlling function in the organization. It is within the realm of controlling to answer management's question, 'Where are we going?'. L. F. Brown, in his book, Developing New For Controlling, points out that the controller within the organization is

ified to answer questions which require

"(a) an appraisal of the future, (b) a knowledge of the past, (c) access to figures throughout the organization, (d) an ability to fit the pieces together in terms of the objectives of the whole community."

Accounting details provide the means of evaluating known conditions and the stepping stones for estimating alternate or future conditions. Accounting also reflects the results of policies and objectives, and points up problems.

These are top-level problems and the controller plays an important part in their consideration and solution. But it is not intended to over-emphasize the controlling function. Obviously, the variety of conditions and problems suggested are operating in nature and accordingly accounting function can only be used to evaluate them. It is pertinent to note at this point that the controller does not control, he simply provides extremely valuable control mechanisms--control itself being a line responsibility."

CHAPTER V

TO PROTECT THE PROPERTIES OF THE BUSINESS

The first two of the five spheres of "service" mentioned in the quoted definition of accounting has been covered. The writer will now pass over temporarily the next two and illustrate the last. This relates to accounting as one of the services used "to protect the properties of the business."

It is interesting and characteristic that this function, originally the only function, is mentioned last. In the early days of accounting, or "bookkeeping," the objective was simply to maintain a record of the various assets and to prevent fraud. Mr. David R. Anderson wrote:

"The 'property protection' function, covers such elementary requirements as keeping accounts with customers, control of cash receipts and expenditures, and proper recording of merchandise inventories and plant assets--in other words, the minimum records necessary to insure against loss to the business through error, carelessness, or fraud. Until comparatively recently this was the major purpose of the record keeping function.¹

For many years after accounting had grown in stature the prime emphasis was still on the balance sheet. The important question was what was owned and what was owed. Mr. H. A. Finney in his textbook Intermediate Accounting, writes:

"Accountants have been primarily concerned, in the past, with presenting a conservative picture of the financial condition in the balance sheet. They have regarded the balance sheet as of primary, and the operating statement as of secondary importance."²

¹Anderson, op. cit., p. 6.

²H. A. Finney, Principles of Accounting, Intermediate (New York: Prentice-Hall, Inc., 1947), p. 192.

TO PROTECT THE PROPERTIES OF THE BUSINESS

The first two of the five spheres of "services" mentioned in the definition of accounting have been covered. The author will now turn to the last two and illustrate the last. This is stated to be as one of the purposes of "to protect the properties of the business." It is interesting and characteristic that this function, originally the only function, is mentioned last. In the early days of accounting, "book-keeping," the objective was simply to maintain a record of the various assets and to prevent fraud. Mr. David E. Anderson wrote:

"The 'property protection' function, covers such elementary principles as keeping accounts with customers, control of cash receipts and expenditures, and proper recording of merchandise inventory and plant assets--in other words, the minimum records necessary to insure against loss to the business through error, carelessness or fraud. Until comparatively recently this was the major purpose of the record keeping function."

For many years after accounting had grown in stature the price tag was still on the balance sheet. The important question was what was owed and what was owed. Mr. H. A. Finney in his Comprehensive Accounting writes:

"Accountants have been primarily concerned, in the past, with providing a conservative picture of the financial condition of the business. They have regarded the balance sheet as of primary, and the operating statement as of secondary importance."

¹ Anderson, op. cit., p. 6.

As aforementioned the profit and loss statement was of secondary significance, but it became mandatory of course, and gained materially in importance with the passage of the income tax amendments to the Constitution. But the growth in usefulness and importance of the profit-and-loss statement, as supported by a great wealth of detail concerning revenues and costs, resulted from and has paced the growth in American industry. This has been brought about because accounting has demonstrated that its greatest value to all management lies in enabling them to keep abreast of development and to control operations under their jurisdiction. The accounting detail relating to all revenues and costs, which provides the material for fixing responsibility for performance and for controlling operating results, grows or diminishes primarily according to the demands of operating management. This will be covered thoroughly in the next chapter.

The use of accounting, consequently, in the "protection of properties" generally is mentioned last in references to the several jobs accounting has to do. Nevertheless, it is still of great importance and might be called the "line" function of accounting. Regardless of the form of business enterprise, there exists the responsibility to account for the investors' capital.

Accounting in relation to protection of properties involves many aspects but here again, it should be emphasized that accounting procedures and requirements to accomplish this responsibility simply conform to management directives.

Except for an accepted absolute minimum, this service is performed to the extent desired. It entails procedures and systems for such things as recording cash, accounts receivable, inventories, properties and other assets

As aforementioned the profit and loss statement was of secondary significance, but it became mandatory of course, and gained materially in importance with the passage of the income tax amendments in the Thirties. But the growth in usefulness and importance of the profit-and-loss statement as supported by a great wealth of detail concerning revenues and costs, resulted from and has forced the growth in American industry. This has been brought about because accounting has demonstrated that its greatest value to all management lies in enabling them to keep abreast of development and to control operations under their jurisdiction. The accounting detail related to all revenues and costs, which provided the material for linked reports with respect to performance and for controlling operating results, grows as it isher primarily according to the demands of operating management. This has covered thoroughly in the next chapter.

The use of accounting, consequently, in the "production of property" generally is mentioned first in reference to the several jobs accounting to do. Nevertheless, it is still of great importance and might be called the "life" function of accounting. Regardless of the form of business enterprise, there exists the responsibility to account for the "owner's" capital. Accounting in relation to production of property involves many but here again, it should be emphasized that accounting procedures and a commitment to accomplish this responsibility imply a desire to maximize objectives.

Except for an accepted specific minimum, this service is performed to the extent desired. It entails procedures and systems for such things as recording cash, accounts receivable, inventories, properties and other

owned by the business. Other controls make it possible to substantiate, between periodical observations, that these assets are actually in possession. Methods must be established to assure that expenditures from, or dispositions of, assets are properly authorized and accounted for. Other systems assure that amounts receivable for services rendered or products sold are properly invoiced and collections made, and that accounts payable and other liabilities are verified and paid. In these activities, accountants establish control on themselves through a system of internal controls. Normally, it is not permitted by those responsible for billing customers to have a hand in making collections and disbursements. Bradford Cadmus and Arthur J. E. Child amplify this point by writing; "Every document affecting a disbursement must be approved elsewhere, and the approval of the disbursements auditor attests to the fact that all is in order."¹

Despite constant efforts of accountants to simplify, these systems and procedures necessitate a great mass of detail and paper work. Operators tend to feel that such "paper work" is solely restrictive in nature and tends to place on them an extra burden.

Although the often-expressed reaction or resistance of operators to paper work is not too graciously received by accountants, it is understandable. The production man, for instance, is interested primarily in production and requires certain tools to do his job. The paper work related to the tools has no direct interest for him on the surface. It is probably relatively

¹Bradford Cadmus and Arthur J. E. Child, Internal Control Against Fraud and Waste: (New York: Prentice-Hall, Inc., 1953), pp. 41-42.

ward by the business. Other controls make it possible to substantiate, between periodic observations, that these results are actually in process. Nations must be established to ensure that expenditures from or disbursements of, assets are properly authorized and accounted for. Other systems assure that accounts receivable for services rendered or products sold are properly invoiced and collection made, and that accounts payable and other liabilities are verified and paid. In these activities, accountants establish control on themselves through a system of internal controls. Generally, it is not permitted by those responsible for billing customers to have a hand in making collections and disbursements. Bradford Graham and Arthur J. E. Child amplify this point by writing: "Every document relating a disbursement must be approved in advance, and the approval of the disbursement unit attests to the fact that all is in order."

Despite constant efforts of accountants to simplify these systems and procedures necessary to a great mass of detail and paper work, operations tend to feel that such "paper work" is solely restrictive in nature and to be placed on them as extra burden.

Although the often-expressed reaction to resistance of operators to paper work is not too drastically received by accountants, it is unfortunate. The production man, for instance, is interested primarily in production and requires certain facts to do his job. The paper work related to the facts has no direct interest for him or the customer. It is probably relatively

¹Bradford Graham and Arthur J. E. Child, Internal Control Analysis (New York: Prentice-Hall, Inc., 1955), pp. 31-32.

tedious and does take time.

Having acquired the tools, some operators may feel the responsibility to protect them lies elsewhere. This is, of course, wholly incorrect. As stated by Theodore P. Lang, "It is men who control, not figure analysis by the accountant."¹

Accounting, as stated hereintofore, is only a service function. It plays only one role in protecting assets, which is not necessarily the main role. The prime responsibility is and must be that of the operator. Operating management at one level or another, depending upon degree of delegation of authority has the specific responsibility for the acquiring, utilizing and maintenance of all assets with exception, in most respects, cash in banks. Transactions recorded by the accountant merely reflect actions or decisions of operators and are based upon information and detail forwarded by them. The more transactions which operating management initiate, the more paper work is required.

It is not the accountant's job to relieve operators of these responsibilities, but well-conceived and well-developed accounting systems and controls can materially lighten operators' burdens. Although accounting procedures and controls purposely serve to provide a check on the operator, they tend, nevertheless, to alleviate his personal responsibility and provide relief to him in respect of his responsibility for the actions of his subordinates. There can be little doubt that without these accounting aids, the operators'

¹Theodore P. Lang, Cost Accountant's Handbook, (New York: The Ronald Press, 1944), p. 10.

... and does take time.

Having acquired the tools, some operators may feel the responsibility to protect them with vigilance. This is, of course, wholly incorrect. As stated by Theodore W. Lund, "It is not the operator's job to protect the tools, but the accountant's."

Accounting, as stated herebefore, is only a service function. It plays only one role in protecting assets, which is not necessarily the role. The prime responsibility is and must be that of the operator. Operating management at any level or number, depending upon degree of delegation of authority has the specific responsibility for the knowledge, utilization and maintenance of all assets with exception, in some respects, cash in banks. Transactions recorded by the accountant merely reflect actions or decisions of operators and are based upon information and detail forwarded by them. The more transactions which operating management initiates, the more paper work is required.

It is not the accountant's job to relieve operators of these responsibilities, but well-conceived and well-developed accounting systems and so-called "lighter operators' burdens." Although accounting procedures are actually designed to provide a check on the operator, they are not controls. They are merely a check on the operator and provide relief to him in respect of his responsibility for the actions of his subordinates. There can be little doubt that without these accounting aids, the operator

time would be severely taxed in "protecting the properties" as compared with time required to complete the necessary forms that are required by the accounting department.

It appears then, that at least on this plane, it should not be too difficult to reach a common understanding of objectives. Possibly the fact that operating management is personally answerable for assets under their jurisdiction has been lost sight of in view of pressures to implement and discharge operating assignments. Mr. John F. Soltis provided a simple illustration which may serve to help keep operators' responsibilities before them:

"Accountants may physically prepare checks, and the treasurer may determine on which bank they are to be drawn, but it is the operator who 'not actually but effectively', signs the check. The operator to whom authority has been delegated to approve time sheets or material requisitions should realize that every time he signs his name, it is tantamount to writing a check on the business's bank account. The accountant's prime responsibility ends if authorized approval is on the document involved.¹

This summary concerning protection of assets only skims the surface. The related paper work also serves many other necessary purposes. As pointed out by H. A. Finney, information is needed as to whether purchases, materials and labor costs are for operators and maintenance or for construction; because expenditures for operations and maintenance are expense, and for construction they are new investment. The effect of these different classes of expenditures on earnings and income taxes is materially different. If a new investment is involved, its nature must be clear, not only that it might be properly recorded for future unification, but also because depreciation applicable thereto varies

¹Statement by John F. Soltis, personal interview.

time would be severely taxed in "protecting the properties" as compared with time required to complete the necessary forms that are required by accounting department.

It appears then, that at least on this plane, it should not be difficult to reach a common understanding of objectives. Possibly the that operating management is personally responsible for assets under their jurisdiction has been lost sight of in view of pressures to implement and discharge operating assignments. Mr. John F. Solitis provided a simple illustration which may serve to help keep operators' responsibilities before

"Accountants may physically prepare checks, and the treasurer may determine on which bank they are to be drawn, but it is the operator who 'not actually but effectively' signs the check. The operator to whom authority has been delegated to approve time sheets or material requisitions should realize that every time he signs his name, it is tantamount to writing a check on the business bank account. The accountant's prime responsibility ends in authorizing approval is on the document involved."

This summary concerning protection of assets only skims the surface. The related paper work also serves many other necessary purposes. As pointed out by H. A. The effect of these different classes of expenses on earnings and income taxes is materially different. If a new investment is involved, its nature must be clear, not only that it might be properly recorded for future depreciation, but also because depreciation applicable thereto

according to usage.¹

Essentially these are accounting or financial problems. But the accuracy of the treatment is largely dependent on the adequacy and correctness of operating information. Misinformation, for one reason or another, can be as serious as insufficient information.

¹Finney, op. cit., pp. 207-211.

According to usage.
Essentially these are accounting or financial problems. But the
way of the treatment is largely dependent on the whys and correct
operating information. Misinformation, for the reasons of another, can be
as serious as insufficient information.

The following is a summary of the main points of the report. It is intended to be a general guide to the reader, and not a detailed account of the work. The report is divided into three main parts: the first part deals with the general principles of the work, the second part deals with the specific details of the work, and the third part deals with the conclusions of the work. The first part is the most important, as it sets out the basic principles which govern the work. The second part is the most detailed, as it gives a full account of the work done. The third part is the most important, as it gives the conclusions of the work. The report is a valuable contribution to the knowledge of the subject, and it is hoped that it will be of use to many people.

CHAPTER VI

FIXING RESPONSIBILITY FOR PERFORMANCE AND CONTROLLING OPERATING RESULTS

Fixing responsibility for performance means distributing responsibility fairly where it belongs. According to Mr. R. B. Knott:

"In order to fix responsibility correctly and to assist executives in the activities, accounting reports should reflect the results of specific units of responsibility. They should segregate and classify, to the utmost degree possible, the results of the activities over which the executives and each supervisor has control. By so doing, every individual with authority can be charged solely with responsibility for results and will be furnished with data which will facilitate improvement of the activities under his direction.¹

In relation to controlling operating results, which is a line responsibility, accounting provides extremely valuable control mechanisms by which the effectiveness or development of overall plans can be gaged and yardsticks of performance can be established.

Perhaps two of the best yardsticks used by accountants in assisting management for fixing responsibility and controlling operating results is through the use of a budget and budgetary control. A budget is merely a collection of figures or estimates which indicate the future in accounting terms.² Budgetary control on the other hand involves careful planning and control of

¹R. B. Knott, "Responsibility Accounting", The Controller, (Vol. XIV, 1946), p. 436.

²John H. McDonald, Practical Budget Procedure, (New York: Prentice-Hall, Inc., 1939), p. 2.

CHAPTER VI

FIXING RESPONSIBILITY FOR PERFORMANCE AND CONTROLLING OPERATING RESULTS

Fixing responsibility for performance means distributing responsi-

bility where it belongs. According to Mr. H. B. Knott:

"In order to fix responsibility correctly and to obtain accu-
rate results in the activities, accounting reports should reflect the
results of specific units of responsibility. They should report
data and classify, to the extent degree possible, the results of
the activities over which the executive and each supervisor has
control. By so doing, every individual with authority can be
charged solely with responsibility for results and will be form-
ulating data which will facilitate interpretation of the activi-
ties under his direction."

In relation to controlling operating results, which is a line res-

ponsibility, accounting provides extremely valuable control mechanism by which
effectiveness or development of overall plans can be gauged and yardstick
performance can be established.

Perhaps two of the best yardsticks used by accountants in assisting
management for fixing responsibility and controlling operating results is
through the use of a budget and budgetary control. A budget is simply a
series of figures or estimates which indicate the future in accounting terms.
Budgetary control on the other hand involves careful planning and control.

¹H. B. Knott, "Responsibility Accounting," The Macmillan, (Col. 1)
1940, p. 100.
²John N. McDonald, "Practical Budget Procedures," (New York: Prentice
Hall, Inc., 1937), p. 2.

all the functions of the enterprise.¹

Through proper budgetary control many advantages accrue to operating management. To list just a few of the advantages:

1. It has a marked influence on the most economical use of working capital, since it is planned to make the maximum use of plant facilities and current assets.
2. It plants definitely-just where it belongs-the responsibility for each function of the business.
3. It acts as a safety signal for management since it indicates the variance between estimates and the actual results obtained.
4. It is invaluable to management in determining the effect of sales, production and financial policies.
5. It compels management to study its markets, products, methods, and service, thus disclosing ways and means for strengthening the business.²

It is in this area of fixing responsibility for performance and controlling results that accounting has grown greatly in stature. It is in these areas that line operators have the greatest personal interest and should make the most demands for service to help them achieve the objectives established by management.

Actually, despite the complexities of business, income taxes and so forth, the accounting procedures necessary simply to account for operating transactions would be relatively simple. The writer is of the opinion, from his limited experience, that if a segregation could be made of accounting services to satisfy minimum and essential requirements on the one hand, and

¹Ibid., p. 89.

²Ibid., pp. 5-6.

services to actively minimize and essential requirements on the one hand, his limited experience, that if a negotiator could be made of accounting transactions would be relatively simple. The writer is of the opinion, forth, the accounting procedures necessary simply to account for operating. Actually, despite the complexities of business, income taxes and by management.

all the functions of the enterprise.¹

internal demands for control and allied purposes on the other, we should find the former to be the tail on the dog.

An illustration of this is found by looking at sales. On a simplified basis, if accountants are informed of amounts sold, they can check prices, note the decrease in inventory, and identify the customer so that he can be billed and subsequent collection can be made. This is actually all that is needed to meet the minimum requirements.

However, there is a great mass of detail and paper work which surrounds a simple sales transaction relating to sales analysis, realizations by commodity, class of trade, type of delivery or package, sales personnel, et cetera. This is "industrial" accounting as applied to the shop, the field and the plant. It has the basic purpose to "serve" management so they may check performance and control results.

Pursuing the sales transaction further, properly designed accounting statements can suggest to a sales manager the following:

1. The cost per unit of his sales effort
2. The marginal limit beyond which further effort becomes uneconomical.
3. The areas which he should cover more thoroughly with sales and service personnel.
4. The class of customers on which to concentrate sales effort.
5. Which products to have salesmen push.
6. Effectiveness of current sales efforts as compared to past periods or average.
7. The need to place advertising, and how much.

If the accountant's internal information is supplemented with industry or regional information from outside sources, the district sales manager has further facts on which to base his decisions. How his sales are as a percentage of the industry, and how they move compared to general economic conditions.

internal demands for control and allied purposes on the other, we should the former to be the tail on the dog.

An illustration of this is found by looking at sales. On a simple basis, if accountants are informed of amounts sold, they can check prices note the decrease in inventory, and identify the customer so that he can billed and independent collection can be made. This is actually all that needed to meet the minimum requirements.

However, there is a great mass of detail and paper work which enters a simple sales transaction relating to sales analysis, classification by city, class of trade, type of delivery or package, sales personnel, at etc. This is "industrial" accounting as applied to the shop, the field and the plant. It has the basic purpose to "serve" management in any way possible for sales and control results.

Pruning the sales transaction further, properly designed account statements can suggest to a sales manager the following:

1. The cost per unit of his sales effort.
2. The terminal limit beyond which further effort becomes uneconomical.
3. The areas which he should cover more thoroughly with sales and service personnel.
4. The class of customers to which to concentrate sales effort.
5. Which products to have salesman push.
6. Effectiveness of current sales efforts as compared to past periods or averages.
7. The need to place advertising, and how much.

If the accountant's internal information is supplemented with information regional information from outside sources, the district sales manager further facts on which to base his decisions. Now the sales are as a part of the industry, and how they move compared to general economic conditions

Whether there is a geographic region where his penetration is adequate. The list could be expanded substantially. The important thing here is not to have an all-inclusive listing of information that the accountant can supply to assist operators, but to suggest how information which is readily available can help the line operator to make the right decisions, to do a better job, to achieve better physical production, and to know that his decisions are based soundly on fact. This is reiterated by Mr. Theodore P. Lang who wrote:

"Workers, foreman, superintendents, and chief operating executives produce goods and spend money. To do their jobs they need facts. Supplying the factual basis for control is a function of accounting."¹

Like a lathe or a hammer, accounting statements can improve production if they are skillfully used. Like these tools, they must be used by line operators if they are to do any good. The accountant's job is to see that their report presentations are properly conceived in relation to the operators' requirements and problems. Accountants have not always fared too well in this respect, as evidenced by J. Brooks Heckert and James D. Willson who write:

"It is in this field, perhaps that the accountant has performed less successfully than in others. A great deal of reporting done by him has been unsatisfactory. Facts have been poorly presented. There has been a tendency to submit mere tabulations or schedules. Little or no attempt has been made to summarize, to digest, or to interpret the data. The information must be refined and highlighted to provide the basis for executive action."²

It is essential for the accountant to keep in mind the fact that every

¹Theodore P. Lang, op. cit., p. 10.

²J. Brooks Heckert and James D. Willson, Controllershship, The Work of the Accounting Executive: (The Ronald Press Company, New York: 1952), p. 387.

Whether there is a geographic region where his presentation is inadequate. That could be expanded substantially. The important thing here is not to an all-inclusive listing of information that the accountant can supply to assist operators, but to suggest how information which is readily available can help the line operator to make the right decisions, to do a better job to achieve better physical production, and to know that his decisions are soundly in fact. This is reiterated by Mr. Theodore P. Levy who wrote:

Foreman, foreman, superintendent, and chief operator expect to produce goods and spend money. To do their jobs they need facts. Supplying the factual basis for control is a function of accounting.¹

Like a lathe or a hammer, accounting statements can improve production if they are skillfully used. Like these tools, they must be used by line operators if they are to be any good. The accountant's job is to see that their report presentations are properly conceived in relation to the operator's requirements and problems. Accountants have not always fared too well in respect, as evidenced by J. Brooks Lockart and James D. Willson who write:

"It is in this field, perhaps, that the accountant has performed less successfully than in others. A great deal of reporting has been done, but the results have been unsatisfactory. There has been a tendency to report mere tabulations or schedules. Little or no attempt has been made to summarize, to digest, or to interpret the data. The information must be refined and highlighted to provide the basis for executive action."²

If it is essential for the accountant to keep in mind the fact that

¹Theodore P. Levy, op. cit., p. 10.

²J. Brooks Lockart and James D. Willson, Controlling Costs, The Ronald Press Company, (New York: 1932), p. 287.

report should have a purpose and should contain the information needed to serve that purpose. Mr. Wilford Reetz, writing in the Journal of Accountancy, gives five questions that the accountant should ask himself when preparing a report:

1. Is it timely?
2. Is it adequate- does it tell the story and serve the purpose for which it was intended?
3. Can it serve as a basis for action?
4. What is the cost of obtaining it?
5. Can we do without it?¹

Line management wants and needs accurate, timely, useful information but it is suggested that accountants do not always meet this want, this interest. Why? There are a multitude of reasons, but in this respect only three possibilities will be covered.

First, the accounting profession is relatively new in its broader aspects. It is not far removed from the days of the long-legged stools and the green eye-shades. Accountants have had to create a philosophy and a complex body of techniques from virtually nothing, and consequently, many did not take the time to go outside the profession to find out just what management wanted and expected from them. In what seemed to be the best manner at the time, the problems were attacked in introspective fashion--bookkeeper discussing with statistician, accountant consulting with accountant, and controller conferring with auditor.

Secondly, the natural tendency has been for accountants to use their

¹Wilford Reetz, "Accountants Reports Should be Written With Prime Consideration For Their Use By Management", Journal of Accountancy, Vol. 1952, p. 451.

report should have a purpose and should contain the information needed to serve that purpose. Mr. Wilford Beek, writing in the Journal of Accountancy gives five questions that the accountant should ask himself when preparing

report:

1. Is it timely?
2. Is it adequate—does it tell the story and serve the purpose for which it was intended?
3. Can it serve as a basis for action?
4. What is the cost of obtaining it?
5. Can we do without it?

Like management wants and needs accurate, timely, useful information but it is suggested that accountants do not always meet this want, this way? There are a multitude of reasons, but in this respect only three are listed will be covered.

First, the accounting profession is relatively new in its broader field. It is not far removed from the days of the four-legged stools and the eye-shades. Accountants have had to create a philosophy and a complex of technicalities from virtually nothing, and consequently, many did not take time to go outside the profession to find out just what management wanted and expected from them. In what seemed to be the best manner at the time, the places were filled in introspective fashion—bookkeeping, discussing with statisticians, accountants consulting with accountants, and controller conferring with auditors.

Secondly, the natural tendency has been for accountants to use

own professional jargon which can be quite vague, difficult to interpret and in some cases actually misleading. This was commented on by Charles R. Hook in an address before a seminar on accounting at Ohio State University:

"The vast majority of people whether they work solely with their hands or their heads, have neither by education, training, nor experience been able to grasp the real meaning of the words 'capital', 'surplus', 'invested capital', 'gross earnings', 'net earnings', 'overhead', 'depreciation', and innumerable other words descriptive of vital factors entering into present day business."¹

However, in this particular area accountants can claim considerable progress in recent years. This problem has received a lot of attention and even the more formal reports have been materially improved. This is evidenced by David R. Anderson who wrote

"For many years the typical corporate annual report was a rather formal document, including only financial statements in the conventional form and a few words of equal conventional comment by the chief executive of the company, but, recently an increasing number of companies have gone to great lengths to make their reports, readable, comprehensive, and informative."²

A third fundamental reason for the failure of accounting to give operating people what they want concerns human relations and communications techniques. In common with many businessmen, accountants did not know much about the art of communication. They evidently followed the prevailing thought that, "the accounting system is a one-way channel in which information moves only from the work level upward and never from the top down."³

¹Charles R. Hook, "Take the Mystery Out of Business", Proceedings of The Sixteenth Annual Institute on Accounting, (May 21, 1953, Ohio State University), pp. 52-53.

²Anderson, op. cit., p. 505.

³Burleigh B. Gardner and David G. Moore, Human Relations in Industry, (Chicago: Richard D. Irwin, Inc., 1950), p. 41.

own professional judgment which can be quite varied, difficult to interpret in some cases actually misleading. This was commented on by Charles E. is an address before a seminar on accounting at Ohio State University:

"The vast majority of people whether they work solely with their hands or their heads, have neither by education, training, nor experience been able to grasp the real meaning of the words 'capital', 'surplus', 'invested capital', 'gross earnings', 'net earnings', 'overhead', 'depreciation', and innumerable other words descriptive of vital factors entering into present day business."¹

However, in this particular area accountants can claim considerable progress in recent years. This problem has received a lot of attention over the more formal reports have been noticeably improved. This is well

by David E. Anderson who wrote

"For many years the typical corporate annual report was a rather formal document, including only financial statements in the conventional form and a few words of equal unconvincing comment by the chief executive of the company. But, recently an increasing number of companies have gone to great lengths to make their reports, readable, comprehensive, and informative."

A third fundamental reason for the failure of accounting to give rising people what they want concerns human relations and communications aspects. In common with many businessmen, accountants did not have much the art of communication. They evidently followed the prevailing though "the accounting system is a one-way channel in which information flows from the work level upward and never from the top down."

²Anderson, op. cit., p. 505.

³Harold E. Garrison and David C. Moore, Modern Explanations in Income (Chicago: Richard D. Irwin, Inc., 1950), p. 43.

Again the accounting system has been viewed by some as one that "lacks the versatility which the line possesses for communicating almost any type of information, for it is limited to certain clearly defined information which is handled in routine fashion."¹

This is an erroneous assumption and both accountants and operating management need to develop a realization that accounting communication affects all aspects of business relationships, and that industrial accounting is essentially a problem of communication. As Yoder has noted in this connection, most concerns emphasize the necessary two-way nature of communication, in which top management is advised of significant items from lower echelons at the same time that information flows downward and across the managerial structure.² Because of the nature of the accounting function, being found and felt at all levels of management, accountants are in a favorable position to keep lines of communication open in all directions. In fact, the two-way communication system conception has been amplified to propose that such communication should be three-way, should include a third dimension in which information is transmitted across the organization as well as up and down.³ Accountants are favorably disposed to transmit information across the organization if they would but recognize their potential in this respect.

One element of communication, as understood today, is the ability to

put oneself in the frame of reference of the other person and to consider, with him, his problems and needs. With accountants, this means going to the field or shop manager and inquiring of him how accountants can help him perform his job.

Accountants have communicated with operators in order to learn their problems, and have designed methods and reports they thought would fit. Many have urged the objective viewpoint from their staffs, and have discussed ways and means of training and developing personnel so that they would have a better grasp of operations and could thereby better relate accounting to operations. But they, on numerous occasions, have not communicated their problems and clearly interpreted their function to operators. They have not sought operators' counsel to the end that their methods and reports would fit operators' needs as operators see them.

As an example, there are extraneous debits and credits occasionally appearing in expense accounts, correcting a cumulative misdistribution or adjusting any of a number of other errors. These debits and credits neatly balance the statements with the accounts, but it is seriously doubted that they are needed. The operators are better served if they are immediately advised of important errors of distribution found after reports are issued so that they can note the change currently. Omission of the corrections so reported may be in conflict with accounting routine, but operators are properly informed.

This brings to mind the "Information Theory", a complex theory concerning actual transmission of communication, an engineering problem now being developed by prominent scientists. Basically, the theory is that communication

but oneself in the line of reference of the other person and to consider with him, his problems and needs. With accountants, this means going to field or shop manager and inquiring of him how accountants can help him form his job.

Accountants have communicated with operators in order to learn the problems, and have designed methods and reports they thought would fit. Have urged the objective viewpoint from their staffs, and have discussed and means of evolution and developing personnel so that they would have a better grasp of operations and could thereby better relate accounting to operations. But they, on numerous occasions, have not communicated their problems and clearly interpreted their function to operators. They have sought operators' consent to the end that their methods and reports would operator needs as operators see them.

As an example, there are extraneous debits and credits occasionally appearing in expense accounts, correcting a cumulative misstatement or adjusting any of a number of other errors. These debits and credits are balanced the statements with the accounts, but it is seriously doubted if they are needed. The operators are better served if they are immediately advised of important errors of distribution found after reports are issued that they can note the change correctly. Omission of the corrections reported may be in conflict with accounting routine, but operators are properly informed.

This brings to mind the "Information Theory", a complex theory concerning actual transmission of communication, an engineering problem now developed by prominent scientists. Basically, the theory is that communication

is useful only to the extent that it transmits news. Whatever part of a message can be predicted need not be transmitted. Or, to put it another way, to transmit that which is already known or unimportant at the receiving end, is waste. The perfect communication therefore is one which omits redundancies and transmits only that which is essential.

This principle suggests a significant possibility as applied to industrial accounting. Conservatively estimated, over half the figures in accounting statements today are either unchanged from the previous period, or the changes are of no immediate concern to line operators. Other information, like pennies where only whole dollars are needed, or dollars where hundreds or thousands will do, only clutters up the statement unnecessarily. This is illustrated pointedly by Adolph G. Lurie who writes:

"It is now common practice in many organizations to eliminate pennies from most statements. Why not go further? For all practical purposes is not the nearest hundred dollars or nearest thousand dollars enough on certain major reports? A review of internal financial statements will quickly indicate the extent that unnecessary digits can be eliminated without reducing the value of data."¹

The controller of Bethlehem Steel Corporation, Mr. Wayne R. Archerd, proved the value of "whole dollar accounting" or "penniless accounting" by stating that a conservative estimate has shown that this system has saved the company thousands of dollars annually.²

This method should be more widely investigated by accountants in general

¹Adolph G. Lurie, "Financial Reports to Plant Operating Executives", The Controller, (Vol. XXI, December, 1953), p. 570.

²Wayne R. Archerd, An address before the Navy Graduate Comptrollership students at George Washington University, November 4, 1955.

is useful only to the extent that it transmits work. Whatever part of a message can be predicted need not be transmitted. Or, to put it another way, the transmitter must know in advance what the receiver is waiting for. The perfect communication therefore is one which omits redundancy and transmits only what which is essential.

This principle suggests a significant possibility as applied to the trial accounting. Conservatively estimated, over half the figures in existing accounts today are either unchanged from the previous period, or changed due to no immediate concern to line operations. Other information is given where only whole dollars are needed, or dollars where hundreds or thousands will do, only clutter up the statement unnecessarily. This is illustrated briefly by Adolph G. Lurie's article:

"It is now common practice in many organizations to eliminate pennies from most statements. Why not go further? For all practical purposes is not the nearest hundred dollars or nearest thousand dollars enough on certain major reports? A review of internal financial statements will quickly indicate the extent that unnecessary digits can be eliminated without reducing the value of data."

The controller of Bethlehem Steel Corporation, Mr. J. H. Archer, proved the value of "whole dollar accounting" or "penniless accounting" by stating that a conservative estimate has shown that this system has saved the company thousands of dollars annually.²

This method should be more widely investigated by accountants in

and line management so that routine information could be omitted from statements which would make them that much more compactly readable. The approach would not be unlike the theory of "Management By Exception," of which much has been accomplished in recent years. Under this theory, briefly stated, management controls by observing exceptions from plans and programs. Fred V. Gardner lists three important advantages of management by exception:

- "1. A complete control of costs is available
2. The control is intimate enough to command respect, compact enough to insure interest, and flexible enough to allow constant revision to keep pace with changing conditions.
3. Key management can look toward details and is never required to build up from details to answer the questions that are the result of good and efficient management."¹

To the extent that accounting detail indicates conformance with budgets, standards or even historical averages, it might be omitted from the statements leaving only variations to be reported for scrutiny.

and line management so that routine information could be omitted from reports which would make them that much more sensibly readable. The approach would not be within the theory of "Management by Exception", of which we have been complaining in recent years. Under this theory, which is stated in management controls by observing exceptions from plans and programs. Gardner lists three important advantages of management by exception:

1. A complete control of costs is available.
2. The control is sufficient enough to control reports, cost, past enough to insure interest, and flexible enough to allow constant revision to keep pace with changing conditions.
3. Key management can look toward details and is never required to build up from details to answer the questions that are the result of good and efficient management."

To the extent that accounting detail indicates concurrence with standards or even historical averages, it might be omitted from the statements leaving only variations to be reported for activity.

CHAPTER VII

SUMMARY

The writer has endeavored to describe the principal functions of industrial accounting, how accounting can and does help operators, and how operating people in the organization have an important part in supplying the basic material. As to the operators, accountants should earnestly continue to solicit their help. Accounting has its fixed responsibilities, but all accounting is essentially a service function rendered for the benefit of management. Unfortunately, it is not always so regarded by representatives of either group, and as a result, friction, misunderstanding and departmental jealousies exist which are preventable. It is hoped that the author has shown that accounting is designed to be constructive in nature and is not intended to be solely restrictive or for policing purposes.

Industrial accounting is essentially a problem of communication, and is a two-way street. Accountants may have, in fact probably have, used it too much one way. Without unduly patting the accounting profession on its collective back, it is fair to state it has made great accomplishments and improvements in its efforts to serve management. Now, accountants must get traffic to flow in the other direction more than they have before. Instead of accountants telling operators what is best for them, perhaps both could profit by having accountants query operators to tell them what they think is good for them. On the other hand, operators probably could make more of an effort to encourage accountants to counsel with them.

Any "gulf" which now exists between accountants and line operators is

CHAPTER VII

SUMMARY

The writer has endeavored to describe the principal functions of industrial accounting, how accounting can and does help operators, and how operators can and do help accounting. As to the operators, accountants should constantly continue to solicit their help. Accounting has its fixed responsibilities, but all accounting is essentially a service function rendered for the benefit of management. Unfortunately, it is not always so regarded by representatives of either group, and as a result, friction, misunderstanding and departmental jealousies exist which are preventable. It is hoped that the author has shown that accounting is designed to be constructive in nature and is not intended to be solely restrictive or for policing purposes.

Industrial accounting is essentially a problem of communication, a two-way street. Accountants may have, in fact probably have, used it much one way. Without unduly putting the accounting profession on its knees, it is safe to state it has made great accomplishments and improvements in its efforts to serve management. Now, accountants must get first to flow in the other direction more than they have before. Instead of always telling operators what is best for them, perhaps they could profit by having accountants query operators to tell them what they think is good for them. On the other hand, operators probably could make more of an effort to encourage accountants to counsel with them.

Any "gap" which now exists between accountants and line operators

not inherent in our industrial way of life. It is merely a symptom of the growing pains through which American industry is living. With an adequate steady two-way flow of information between shop and office, the accountant will be able to render greater service to the ultimate benefit of operators, by reason that operators will have a better understanding of accounting's responsibilities, capabilities and potentialities.

not inherent in our industrial way of life. It is merely a symptom of the growing pains through which American industry is living. With an adequate steady two-way flow of information between shop and office, the economy will be able to render greater service to the ultimate benefit of operator. By reason that operators will have a better understanding of accounting responsibilities, capabilities and possibilities.
